According to our (Global Info Research) latest study, the global Biological Filter Media market size was valued at USD million in 2022 and is forecast to a readjusted size of USD million by 2029 with a CAGR of % during review period.

Biological Filter Media is a type of filter media that supports the growth of beneficial bacteria that perform biological filtration in aquatic systems. Biological filtration is the process of converting toxic ammonia and nitrite, which are produced by fish waste and organic decomposition, into less harmful nitrate, which can be removed by water changes or plants. Biological Filter Media provides a large surface area and a porous structure for the bacteria to attach and colonize, forming a biofilm that degrades the pollutants.
