## Abstracts

Because cotton, soybeans, fruits and vegetables are important drivers of the nematicides market. In North and South America, genetically modified crops account for the largest area, and high investment related to agricultural inputs such as seeds will become one of the main driving forces for the adoption of biocide. Infestations by biocides are difficult to detect and are usually attributed to other causes, whose harm is often underestimated. The large-scale elimination of active ingredients used to control nematodes will also promote the use of new and innovative control measures. The growing environmental problems associated with the use of chemicals to control nematodes have paved the way for the use of biological control methods. As consumers become more aware of the importance of organic food, the adoption of sustainable agriculture and integrated pest management solutions has increased.

According to our (Global Info Research) latest study, the global Biological Nematicides market size was valued at USD million in 2022 and is forecast to a readjusted size of USD million by 2029 with a CAGR of % during review period. The influence of COVID-19 and the Russia-Ukraine War were considered while estimating market sizes.
