Abstracts

Biological control is the use of living organisms to maintain pest populations below damaging levels.

SCOPE OF THE REPORT:

Biological control or biocontrol is a method of controlling pests such as insects, mites, weeds and plant diseases using other organisms. It relies on predation, parasitism, herbivory, or other natural mechanisms, but typically also involves an active human management role. It can be an important component of integrated pest management (IPM) programs.

Importation, augmentation and conservation of natural enemies constitute the three basic approaches to biological control of insects. Specific techniques within these approaches are constantly being developed and adapted to meet the changing needs of pest management. Improvements in rearing and release techniques and genetic improvement of natural enemies have resulted in more effective augmentation programs. Application of new ecological theory is transforming the way we look at conservation of natural enemies. Continued refinement and adaptation of biological control approaches and applications are necessary if the full potential of this biologically based pest management strategy is to be fulfilled.

The global Biological Pest Control market is valued at 560 million USD in 2018 and is expected to reach 960 million USD by the end of 2024, growing at a CAGR of 11.2% between 2019 and 2024.

The Asia-Pacific will occupy for more market share in following years, especially in

China, also fast growing India and Southeast Asia regions.

North America, especially The United States, will still play an important role which cannot be ignored. Any changes from United States might affect the development trend of Biological Pest Control.
