Abstracts

The global Biologics Water-free Thawing System market size is expected to reach \$ million by 2029, rising at a market growth of % CAGR during the forecast period (2023-2029).

To date many Cell Therapy companies have understandably focused on testing the effects of their products in small scale manufacturing which may not require cryopreservation. As more products move into clinical trials and towards market authorisation there is growing attention on the challenges of scaling up, which nearly always involves cryopreservation. Thawing is one of the final processes manufacturers need to control right at the end of the cryogenic cold chain. If thawing is not well controlled, cells that manufacturers have invested enormous amounts of time and money creating, may die. With increasing focus on the challenges of scaling up and implementing a robust cryochain for cellular therapies, it is an ideal time to launch the Automated Thawing System.

How cells are thawed determines their viability and function. Conventionally, cells are thawed in a water bath at 37°C. This practice is problematic, because water baths pose contamination risks. They also require calibration and validation. Most importantly, water baths do not provide a record of the thaw process. Water-free Thawing System overcomes many of the issues inherent in water baths.
