Abstracts

The global Biomass Circulating Fluidized Bed Boiler market size is expected to reach \$ million by 2029, rising at a market growth of % CAGR during the forecast period (2023-2029).

Biomass circulating fluidized bed (CFB) boiler is a type of boiler that utilizes a circulating fluidized bed technology to combust biomass fuels. In a biomass CFB boiler, biomass fuels such as wood chips, agricultural residues, and energy crops are burned in a high-temperature and oxygen-rich environment. The combustion process takes place in a fluidized bed, where the solid particles (biomass fuel) are suspended and mixed with a stream of combustion air. The circulating fluidized bed technology allows for a more efficient and complete combustion of biomass fuels, resulting in higher energy conversion rates and lower emissions compared to traditional combustion technologies. The turbulent mixing of the fuel and air in the fluidized bed promotes a more uniform temperature distribution, reducing the formation of nitrogen oxides (NOx) and other harmful pollutants. Biomass CFB boilers are widely used in industries that require steam or hot water, such as power generation, pulp and paper, chemical, and food processing. They offer advantages such as flexibility in fuel choice, high combustion efficiency, and the ability to handle a wide range of biomass fuels with varying moisture content and particle size.
