According to our (Global Info Research) latest study, the global Biomass Pyrolysis Plant market size was valued at US\$ 120 million in 2024 and is forecast to a readjusted size of USD 201 million by 2031 with a CAGR of 7.9% during review period.

Biomass Pyrolysis Plant is used to convert various types of biomass—such as wood chips, coconut shells, rice husks, and agricultural waste—into biochar (a form of charcoal) through a thermal decomposition process known as pyrolysis. Operating in an oxygen-limited environment, the machine heats biomass to high temperatures (typically 400–800°C), releasing volatile gases and leaving behind carbon-rich charcoal. The process improves biomass energy density, reduces waste volume, and produces by-products like wood vinegar and tar, which can be reused.
