Abstracts

According to our (Global Info Research) latest study, the global Biometric Filters market size was valued at US\$ 433 million in 2025 and is forecast to a readjusted size of US\$ 607 million by 2032 with a CAGR of 4.8% during review period.

Biometric filters are precision optoelectronic thin-film components that, through special spectral design, allow only specific wavelengths of light (typically near-infrared light) to pass through. This enables smartphones, AR/VR devices, and security systems to perform accurate 3D facial recognition, iris recognition, fingerprint recognition, and gesture recognition, among other biometric feature extraction and authentication functions. They are core components for achieving high-precision motion interaction and secure identification.

The upstream segment mainly consists of suppliers of optical glass substrates (such as D263T and quartz glass), high-purity coating materials, and polishing fluids. This segment has high technological barriers, and the core substrate market has long been monopolized by giants such as Schott of Germany and Corning of Japan, giving them strong bargaining power. Global sales are projected to reach approximately 484 million units in 2025. Product prices mainly depend on requirements such as wavelength, bandwidth, diameter, and material, with market prices ranging from \$0.5 to \$20 per unit. The industry's gross profit margin is in the range of 25%?35%.

The biometric filter industry is currently in a critical expansion phase, rapidly diversifying from consumer electronics such as smartphones into various fields including automotive electronics, healthcare, and industrial vision. The core driving force behind this expansion is the continuous penetration and performance improvement of existing

technologies in smart devices, particularly 3D sensing (especially structured light and ToF) and under-display optical fingerprint recognition. Furthermore, increasingly stringent regulations worldwide regarding data privacy and information security are also objectively promoting the application of highly reliable optical components as the foundation of biometric hardware.
