Rapid technological advancements in the field of biometric recognition and identification systems along with advancements in computing and other supporting fields, fueled companies spending significantly on research and development in the biometric systems domain. Such technical accomplishments have stemmed from a strong emphasis on the application of such technologies by national governments, which have in turn resulted in a sharp decline in prices of scanning devices and associated components, in the process providing further impetus to investment in the sector.

Scope of the Report:

This report studies the Biometrics Spending in Government market status and outlook of Global and major regions, from angles of players, countries, product types and end industries; this report analyzes the top players in global market, and splits the Biometrics Spending in Government market by product type and applications/end industries.

Security of data and assets has been a key concern for enterprises, banks, government organizations, telecommunications, hospitals, as well as individuals. Keys, identity badges, and numeric keypads were previously being used to prevent unauthorised access. Technological advancements resulted in the introduction of two-factor authentication, wherein individuals could gain access to secure premises after being authenticated using two different components, such as hardware devices and numeric codes. However, hackers also could easily gain access to hardware devices and obtain numeric codes.

In 1999, biometrics was introduced to identify individual traits based on behavioural and physiological characteristics of individuals that could not be replicated easily. It includes

voice recognition, palm geometry recognition, DNA identification, gait recognition, fingerprint matching, facial recognition, iris recognition, signature verification, and vein recognition. Also, biometrics are considered to be more reliable compared to physical devices and numeric codes. In addition, biometric traits cannot be lost or forgotten by an individual. Biometrics use verification and identification to authenticate an individual. Verification is a one-on-one process used to match biometric traits of an individual against a particular template. However, identification is a matching process where the biometric traits of an individual are matched against all templates in the database to determine an individual's identity.
