## Abstracts

According to our (Global Info Research) latest study, the global Bionylon Fiber market size was valued at US\$ 998 million in 2025 and is forecast to a readjusted size of US\$ 2508 million by 2032 with a CAGR of 14.2% during review period.

Bionylon fiber is a high-performance polyamide material made from renewable biomass resources (such as castor oil, corn sugar or microbial fermentation products) through biotechnology or chemical synthesis. Its core ingredients come from plant-derived diamines (such as bio-based pentamethylenediamine) or dibasic acids, which replace traditional petroleum-based monomers.

Common bionylon fiber types include PA 1010, PA 1012, PA11, PA10T, PA610, PA510, PA56, PA12, PA6T, PA410, PA513, PA6, etc. Bionylon fiber combines environmental protection with excellent mechanical properties, including wear resistance, heat resistance and processability, and can significantly reduce carbon footprint. It is an important breakthrough in green material science.

With the promotion of the global 'dual carbon' goal, consumers and brand owners prefer sustainable materials to reduce the carbon emissions of petroleum-based nylon. As a green, environmentally friendly and renewable material, bionylon fiber is in line with the concept of sustainable development, so it has received widespread attention and favor.

Major countries around the world have deployed the bioindustry as a strategic emerging industry and introduced a series of policies to promote the development of bionylon fiber materials. For example, the EU's 'Green New Deal', China's '14th Five-Year Plan' bioeconomic development plan, and many countries provide subsidies or tax incentives.

The improvement of technologies such as biological fermentation and catalytic conversion has reduced the production cost of bionylon fiber and made the performance of bionylon fiber close to or surpass petroleum-based products.

In the future, manufacturers related to the bionylon fiber industry will develop non-food biomass and synthetic biology to prepare key monomers (such as bio-based hexamethylenediamine) to meet the ever-changing market and demand.

With the continuous advancement of technology and the continuous promotion of policies, the production capacity and investment scale of bionylon fiber will continue to expand, providing more high-quality products to the market.

With the increase in consumer demand for environmentally friendly materials and the continuous improvement of bionylon fiber performance, its application areas will continue to expand, including textiles, automobiles, electronic equipment and medical devices.

In order to reduce costs, improve production efficiency and product quality, the production technology of bionylon fiber will continue to innovate and improve, and product performance will continue to improve.
