Abstracts

The global Biopharmaceutical Membrane Filtration market size is expected to reach \$ 14884 million by 2032, rising at a market growth of 3.5% CAGR during the forecast period (2026-2032).

Biopharmaceutical membrane filtration is a membrane separation process used in drug research and production for sterilization, clarification, concentration, buffer replacement, virus removal, and pretreatment before aseptic filling. It relies on technologies such as microfiltration, ultrafiltration, and nanofiltration to ensure the purity and safety of the drug solution.

Upstream components include membrane materials, membrane modules, filter cartridges, disposable consumables, pumps and valves, pressure vessels, sensors, automatic control systems, and cleanroom piping; downstream products target antibody drugs, vaccines, cell and gene therapy, recombinant proteins, and sterile formulation companies.

The global biopharmaceutical membrane filtration market has a unit price of \$1916, with global sales of approximately 5.9 million units and an annual production capacity of 7-8 million units. The industry profit margin is approximately 28%.

The future global biopharmaceutical membrane filtration market will develop towards higher safety, disposable, continuous, and intelligent directions. With the rapid development of biopharmaceuticals such as monoclonal antibodies, vaccines, and cell and gene therapies, manufacturers are continuously increasing their requirements for sterilization filtration, virus retention, protein concentration, and process scale-up stability. Disposable systems will further reduce the risk of cross-contamination and

shorten the validation cycle, while automated monitoring and digital quality control will become core upgrade directions. Future competition among companies will focus on membrane material performance, flux stability, low protein adsorption, regulatory compliance, supply chain security, and overall process solution capabilities.
