Abstracts

A biopharmaceutical, also known as a biologic (al) medical product, biological, or biologic, is any pharmaceutical drug product manufactured in, extracted from, or semi synthesized from biological sources. Different from totally synthesized pharmaceuticals, they include vaccines, blood, blood components, allergenic, somatic cells, gene therapies, tissues, recombinant therapeutic protein, and living cells used in cell therapy. Biologics can be composed of sugars, proteins, or nucleic acids or complex combinations of these substances, or may be living cells or tissues. They (or their precursors or components) are isolated from living sources—human, animal, plant, fungal, or microbial.

SCOPE OF THE REPORT:

It is costly to discover and develop new drugs/medicines due to expensive research processes, Costs associated with clinical trials, resource-intensive approval procedures and costs associated

With manufacturing (if the trials are successful).

An additional point is that European R&D costs are higher than in other world regions due to the fragmented European patent system. The implications of a fragmented patent system in Europe include high uncertainty, quality drop and prohibitive costs, which are at least four times higher than in the US, China and South Korea thus constituting a financial burden on especially small biopharmaceutical enterprises in %li%Europe (van Pottelsberghe 2009).

The worldwide market for Biopharmaceuticals is expected to grow at a CAGR of roughly xx% over the next five years, will reach xx million US\$ in 2024, from xx million US\$ in

2019, according to a new GIR (Global Info Research) study.
