Abstracts

According to our (Global Info Research) latest study, the global Biopolymer Coatings market size was valued at USD 870.8 million in 2023 and is forecast to a readjusted size of USD 1203.3 million by 2030 with a CAGR of 4.7% during review period.

Biopolymer coating is the coating using polymers obtained from living organisms such as DNA, RNA, starch, cellulose and proteins. The biopolymer coating is an eco-friendly alternative to petroleum based coating solutions offering broad coating applications and usage while achieving desired biodegradability. The biopolymer coating is suitable to be used on various fibre and paper materials as it can be applied using conventional spray systems. Recent innovations in technology have developed new biopolymer coating in the market with appropriate biocompatibility, degradation rate and physical properties for various industry specific coating applications.

Shift in consumer preference towards eco-friendly and cost-effective materials usage in packaging industry should favor biopolymer coatings market size. They are derived alone or in combination from lipid, proteins & polysaccharides. Antioxidants, antimicrobial agents and pigments are added during production process to improve product properties. High flexibility, low oxygen, water vapor permeability, and rigid mechanical strength are key properties which should boost biopolymer coatings demand. Recyclable and biodegradable products generate less scrap materials and thereby enhance production process.
