Abstracts

The global Bioprinting Services market size is expected to reach \$ 438 million by 2032, rising at a market growth of 8.9% CAGR during the forecast period (2026-2032).

Bioprinting Services refers to contract services that utilize 3D bioprinting technology to deposit cells, bioinks, scaffold materials, extracellular matrices, drugs, or bioactive factors into specific spatial structures in accordance with client requirements to create tissue models, disease models, tumor models, organoid models, drug screening models, tissue engineering scaffolds, or early-stage regenerative medicine samples. The business model typically extends beyond the mere sale of bioprinters; instead, it involves providing pharmaceutical companies, CROs, research institutions, hospitals, regenerative medicine enterprises, and cosmetics firms with model design, printing process development, cell culture, in vitro testing, data analysis, and customized biomanufacturing services.

Pharmaceutical companies seek to replace traditional 2D cell assays and certain animal experiments with 3D tissue models that more closely mimic the microenvironment of human tissues; consequently, demand for bioprinting services specifically for tumor, hepatotoxicity, skin, and vascularized tissue models, as well as organoids is experiencing rapid growth. BICO, in collaboration with CELLINK, MatTek, and Visikol, previously launched contract research services for bioprinting, demonstrating the ongoing integration of bioprinting technology with Contract Research Organizations (CROs), in vitro models, and analytical services.

The market is gradually evolving from a focus on 'selling equipment and bioinks' toward the provision of 'platform-based services.' While CELLINK continues to center its operations on bioprinters and bioinks to serve researchers across the pharmaceutical,

academic, and industrial sectors, Inventia Life Science's RASTRUM platform emphasizes the creation of reproducible and scalable 3D cell models for use in drug discovery and disease research.

Tumor drug screening and precision medicine have emerged as some of the most rapidly commercializing application areas within this field. Carcinotech, for instance, offers 3D bioprinted tumor models derived from patient samples for use in drug testing, efficacy assessment, and precision medicine research—a development that signals a shift from providing general scientific research support toward delivering high-value preclinical testing services.
