Bioprostheses has shown significant advances from past few years, as their basic characteristic, they become degraded until their complete elimination in the host body. Bioprosthesis will gradually degrade in the recipient will determine the formation of a neotissue in its place, which will completely replace the biomaterial in the long term. Ideally, the bioprosthesis are to achieve not only the repair of the damaged zone but also the regeneration of an adequately organized tissue that will promote angiogenesis and even recruit growth factors acquiring characteristics similar to those of healthy tissue.
