Bioterrorism is terrorism involving the intentional release or dissemination of biological agents. These agents are bacteria, viruses, fungi, or toxins, and may be in a naturally occurring or a human-modified form, in much the same way in biological warfare.

SCOPE OF THE REPORT:

This report studies the Bioterrorism market status and outlook of Global and major regions, from angles of players, countries, product types and end industries; this report analyzes the top players in global market, and splits the Bioterrorism market by product type and applications/end industries.

Bioterrorism refers to form of terrorism that involves intentional dissemination or release of biological agents. The agents can be viruses, bacteria or toxins and can also be referred to as germ warfare. Biological agents are mainly found in nature but sometimes they can be modified by the terrorist as to make agents more toxic. Biological agents are used by the terrorists to attain their social or political goals and are used for killing or injuring people, plants and animals. Biological weapons are dangerous as some of these agents are transmitted from one person to another and infection might take hours or days to become noticeable.

Bioterrorism is an invaluable tool as biological agents are relatively inexpensive and can cause widespread fear beyond the actual damage they can cause. They are mainly used by the terrorists to create mass panic and disruption of state or economy. The global market for bioterrorism is segmented on the type of different biological agents currently being used and their mode of delivery. Agents such as anthrax, tularemia, small pox, bubonic plague, botulinum toxin and viral hemorrhagic fevers pose a high threat to national security.

The global Bioterrorism market is valued at xx million USD in 2017 and is expected to
