Biotype absorbable bone rods are medical devices used to treat fractures that require stability during the healing process. This is an implant made of biodegradable materials designed to provide temporary support for bone healing. Biotype absorbable bone rods are commonly used in orthopedic surgeries to treat long bone fractures such as the femur, tibia, and humerus. This device is implanted into the bone and provides stability and support during bone healing. Over time, the substances in the rod are gradually absorbed by the body, leaving only natural bone tissue. Biotype absorbable bone rods are made of biodegradable polymer materials, which are designed to be sturdy and durable, but flexible enough to allow bones to move naturally during the healing process. This material also has biocompatibility, which means it will not cause adverse reactions in the body. One of the main advantages of bio absorbable bone rods is that once the bone heals, there is no need for a second surgery to remove the implant. This can reduce the risk of surgical complications such as infections and scars.
