According to our (Global Info Research) latest study, the global Bipolar Motor Drivers market size was valued at US\$ million in 2024 and is forecast to a readjusted size of USD million by 2031 with a CAGR of %during review period.

A Bipolar Motor Driver is a type of motor driver used to drive bipolar (also known as bidirectional) DC motors. Bipolar motors typically have two coils (also called phases), each with two polarities, positive and negative. The function of the bipolar motor driver is to control the current of the two coils of the motor according to the control signal, thereby controlling the steering and speed of the motor. Bipolar motor drivers are often used in applications that require control of the motor's direction of rotation and speed, such as robotics, automation equipment, automotive, marine, etc. It can control the movement of the motor by changing the direction and magnitude of the current, and realize functions such as forward rotation, reverse rotation, stop and speed regulation. Different bipolar motor drivers have different control methods, such as pulse width modulation (PWM) control, DC voltage control (H-bridge), etc.
