Abstracts

Bispecific T cell-engagers (BiTEs) are small antibody-based molecules composed of two antigen-binding single-chain variable fragments (scFvs) genetically fused by a flexible peptide linker and capable of redirecting T cells against tumour-associated antigen (TAA)-bearing cancer cells. By binding T cells and tumor cells through the specific structure, bispecific T cell engagers enhance tumor lysis effectually and provide relapse/refractory patients with feasible options regardless of mutations or T cell dysfunction.
