## **Abstracts**

Bisphosphonates are drugs that inhibit mineralization or resorption of the bone by blocking the action of osteoclasts. Bisphosphonates are enzyme-resistant analogues of pyrophosphate, which normally inhibits mineralization in the bone. Their effect is dose dependent and they reduce the turnover of bone by inhibiting recruitment and promoting apoptosis of osteoclasts. Bisphosphonates are used to treat postmenopausal and glucocorticoid induced osteoporosis, Paget's disease of bone and malignant hypercalcemia.
