According to our (Global Info Research) latest study, the global Black-Body Radiation Thermometer market size was valued at USD 1248.1 million in 2022 and is forecast to a readjusted size of USD 1916.2 million by 2029 with a CAGR of 6.3% during review period.

Black-body radiation thermometer is a thermometer which infers temperature from a portion of the thermal radiation sometimes called black-body radiation emitted by the object being measured. Black-body radiation thermometers gauge temperature based on the radiation released from an object. An object's ability to release radiation is called its emissivity—the more emissive an object is the more radiation a sensor has to work with. Sensors in this category include spot measuring devices that can produce 1-D and 2-D temperature readings, as well as thermal imaging thermometers which can display temperature data as a 2-D image.
