According to our (Global Info Research) latest study, the global Black-box Web Vulnerability Scanners market size was valued at US\$ million in 2025 and is forecast to a readjusted size of US\$ million by 2032 with a CAGR of %during review period.

With the modern cybersecurity threat landscape continuously changing, one of the best ways for organizations to keep up with the onslaught of security vulnerabilities is through penetration testing their websites and web applications for serious vulnerabilities such as SQL Injection and Cross-site Scripting (XSS). The most effective way of automating a lot of the work carried out in manual penetration testing is through the use of a black-box vulnerability scanner. Black-box scanners work over the HTTP/HTTPS protocol and do not require access to the application source code. Moreover, since a black-box web application vulnerability scanner does not know anything about the application it is attacking, it closely mimics the behaviour of a real attacker. This makes black-box web vulnerability scanners ideal for automating web application security in large and complex organizations where manual vulnerability testing would not be able to scale quick enough to cope with the speed at which security issues are introduced within code. Automated black-box security scanners like Acunetix allow organizations to scan anywhere from a handful, to thousands of web applications and web services quickly, cost effectively and, most importantly, continuously.
