According to our (Global Info Research) latest study, the global Black Carbon Monitors market size was valued at USD 323.1 million in 2023 and is forecast to a readjusted size of USD 474.6 million by 2030 with a CAGR of 5.6% during review period.

Scientists who study climate change have become increasingly interested in the role of black carbon. Black carbon particles play a major part in climate change by absorbing solar radiation and re-radiating the energy as heat, warming the local atmosphere. Black carbon is emitted by combustion processes, particularly in diesel engine exhaust and biomass burning. Thus black carbon is used as a marker of these combustion processes for air quality monitoring.
