The global Blind Spot Detection (BSD) System and Adaptive Cruise Control (ACC) System market size is expected to reach \$ 7153 million by 2032, rising at a market growth of 6.3% CAGR during the forecast period (2026-2032).

Blind Spot Detection (BSD) system is a sensor based detection system implemented in automobiles that is used for monitoring vehicles at the rear and side of the driver/vehicle. Such systems generate tactile, audible, vibrating or visual form of warnings. They also assist the driver at the parking lots when there are other vehicles approaching from the sides. Blind spots are caused due to various objects such as passengers, headrests and window pillars. Mirrors are generally used to remove the blind spots but the disadvantage being that they leave huge dead on all the sides of the vehicle. BSD systems, with the help of cameras and sensor systems generate information about various objects that are outside the range of driver's vision.

Adaptive cruise control is similar to conventional cruise control in that it maintains the vehicle's pre-set speed. However, unlike conventional cruise control, this new system can automatically adjust speed in order to maintain a proper distance between vehicles in the same lane. This is achieved through a radar headway sensor, digital signal processor and longitudinal controller. If the lead vehicle slows down, or if another object is detected, the system sends a signal to the engine or braking system to decelerate. Then, when the road is clear, the system will re-accelerate the vehicle back to the set speed.

Europe is the largest Blind Spot Detection (BSD) System and Adaptive Cruise Control (ACC) System market with about 36% market share. North America is follower,
