## Abstracts

Alzheimer's disease is a progressive neurodegenerative disorder that primarily affects the brain, leading to cognitive decline and memory loss. It is the most common cause of dementia, a syndrome characterized by a decline in cognitive function that interferes with daily life. Alzheimer's disease is named after Dr. Alois Alzheimer, who first identified the condition in 1906.

Currently, there is not significant leading product on the market, and the competition landscape for AD diagnostic reagents is relatively good. In the future, with the approval of more accurate mass spectrometry and other kits, the application of combined detection methods, and the approval of more AD treatment drugs, the AD diagnostic industry has huge development potential, and the market space may further expand.

The cerebrospinal fluid (CSF) biomarkers, that were first developed by Fujirebio more than 25 years ago, have evolved over time from research biomarkers into specialized diagnostic testing tools, and from manual usage by early adopters to a widespread implementation in fully automated routine testing today.

Diagnosis for Alzheimer's disease using CSF samples allows the detection of four proteins: two forms of amyloid (A $\beta$ 1-42 and A $\beta$ 1-40) proteins and two forms of Tau (Total Tau and phospho-Tau) proteins. If a patient has Alzheimer's disease, then these proteins will be present in abnormally low (A $\beta$ 1-42 and A $\beta$ 1-42/A $\beta$ 1-40 ratio) and high (Total Tau and phospho-Tau) levels. The A $\beta$ 1-42 levels and the A $\beta$ 1-42/A $\beta$ 1-40 ratio will even be low long before the symptoms of the disease start to show.

In the clinical community today, there are high hopes for the use of blood-based testing

for even simpler and potentially more widespread testing for Alzheimer's disease in clinical routine.

According to our (Global Info Research) latest study, the global Blood-based Detection Kit for Early Diagnosis of Alzheimer's Disease market size was valued at US\$ 35.6 million in 2023 and is forecast to a readjusted size of USD 125 million by 2030 with a CAGR of 18.2% during review period.

**Rising Prevalence of Alzheimer's Disease:** The increasing global prevalence of Alzheimer's disease is a significant driver for the development of early diagnosis kits. As the aging population grows, the demand for reliable diagnostic tools for early detection becomes more critical.

**Focus on Early Intervention and Treatment:** With the recognition that early intervention and treatment may have a more significant impact on disease progression, there is a growing emphasis on the development of tools that enable early diagnosis. This shift in therapeutic strategies encourages investment in early detection technologies.

**Technological Innovations in Diagnostics:** Advances in diagnostic technologies, including imaging techniques, molecular diagnostics, and blood-based assays, contribute to the development of more sophisticated and precise early diagnosis kits. These innovations enhance the sensitivity and specificity of diagnostic tools.
