## Abstracts

The blood collection and puncture robot is used for automatic blood sample collection before medical examination and analysis, alleviating the shortage of nurses, and freeing nurses from the blood collection work with high frequency, high difficulty, high risk and low clinical value.

The blood collection and puncture robot can automatically complete disinfection and puncture operations, replacing medical workers in contact with patients, and is equipped with its own disinfection system to minimize cross-infection; robots have stronger imaging capabilities, recognition capabilities, operational stability, and procedures than humans. It improves the execution efficiency of the work, and solves the problems of low success rate of venipuncture and high accident rate.

The blood collection and puncture robot uses near-infrared light and ultrasonic dual-mode imaging to identify blood vessels at different scales. With the help of algorithms, the position changes of puncture needles and blood vessels can be dynamically tracked. Integrate its own disinfection system to ensure the hygienic conditions of the machine system and ensure a sterile environment that meets medical standards.
