According to our (Global Info Research) latest study, the global Blood Exosome Isolation and Purification Kit market size was valued at US\$ 39.10 million in 2025 and is forecast to a readjusted size of US\$ 131 million by 2032 with a CAGR of 18.6% during review period.

A Blood Exosome Isolation and Purification Kit is a laboratory kit designed to isolate and clean exosomes, or small extracellular vesicles, from blood-derived samples such as serum and plasma for downstream research and analysis. These kits are used to obtain intact exosomes with suitable yield and purity more easily and consistently than traditional ultracentrifugation, and they may use precipitation reagents, resin or column purification, filtration, magnetic capture, or related methods depending on the product design. They are commonly used in biomarker discovery, liquid biopsy research, RNA and protein analysis, and extracellular vesicle characterization because blood is one of the most important and widely used sample sources in exosome studies. In 2025, global Blood Exosome Isolation and Purification Kit production reached approximately 112 K Unit.

The Blood Exosome Isolation and Purification Kit market is being driven by the growing use of blood-based exosomes as liquid biopsy biomarkers in cancer and other disease research. Recent reviews describe blood-derived extracellular vesicles and exosomes as promising non-invasive tools for early detection, prognosis, and treatment monitoring, while broader liquid-biopsy literature continues to highlight demand for blood-based diagnostic approaches that are less invasive than tissue biopsy. As a result, laboratories and developers increasingly need reliable kits that can isolate and purify exosomes from serum and plasma with consistent yield and quality.

Another major driver is the expansion of translational research and clinical development, where blood is one of the most practical and widely used sample types. Reviews published in 2024-2025 emphasize that exosome isolation from human blood remains technically important but challenging because plasma and serum contain interfering components, which creates demand for better standardized purification methods and easier-to-use commercial kits. At the same time, recent market analyses describe kits and reagents as a core product segment within the broader exosome research market, reflecting rising purchasing activity from academic labs, biotech companies, and diagnostic developers.

The market is also benefiting from ongoing technology improvement in isolation and purification workflows. Recent scientific reviews report rapid progress across precipitation, ultrafiltration, size-exclusion chromatography, immunoaffinity capture, magnetic separation, and microfluidic platforms, with increasing interest in combined methods that improve purity and reproducibility for blood samples. These advances are helping move the field toward more standardized, workflow-friendly products, which supports broader adoption of blood exosome isolation and purification kits in biomarker discovery, assay development, and future clinical applications.
