Abstracts

Viral testing is carried out to detect infections caused by viruses by destroying cells of immune system. Viruses breed only in living cells and cause diseases by destructing or injuring the cells they infect, damaging the body's whole immune system, altering the genetic material (DNA) of the cells they infect, or cause inflammation that can damage the complete organ. A viral infection can occur in different parts of the body such as intestine, respiratory tract and lungs. Common viral infections include common cold which is caused due to infection in the upper respiratory tract and influenza. Diagnostic virology is formulating diagnosis of viral disease and is moving rapidly mainstream in clinical medicine. Blood tests play a crucial role in diagnosing viral infections through various tests such as antibody testing, viral DNA or RNA detection tests. These test can show the exact virus causing an infection in the body.
