## Abstracts

According to our (Global Info Research) latest study, the global Blue Green Algae Sensors market size was valued at US\$ million in 2024 and is forecast to a readjusted size of USD million by 2031 with a CAGR of %during review period.

In this report, we will assess the current U.S. tariff framework alongside international policy adaptations, analyzing their effects on competitive market structures, regional economic dynamics, and supply chain resilience.

The cyanobacteria sensor uses the absorption and emission peaks of cyanobacteria in the spectrum to emit monochromatic light of a specific wavelength to the water body. After the cyanobacteria in the water absorb the energy of this monochromatic light, they release monochromatic light of another wavelength. The light intensity emitted by the cyanobacteria is proportional to the content of cyanobacteria in the water. By measuring the target parameters based on the fluorescence of the pigment, it is possible to identify algal blooms before they affect the environment.
