Boat Mooring Buoy is a device that floats on the water surface and is specifically designed to provide a fixed point for boats to moor and tie up. It is usually made of corrosion-resistant materials (such as high-strength plastics, rubber or steel), has good buoyancy and weather resistance, and can withstand the tension and fluctuations when a ship approaches. Mooring buoys are usually connected to the seabed or the bottom of the water through chains, ropes, etc., so that they maintain a fixed position on the water surface, providing a safe and stable mooring point for ships. Boat mooring buoys are widely used in waters such as ports, coastlines, lakes and rivers to ensure that ships can be safely moored when not docked to prevent ships from drifting or being washed away.
