## Abstracts

The global Body Cell Defect Passivation Equipment market size is expected to reach \$ million by 2029, rising at a market growth of % CAGR during the forecast period (2023-2029).

The market prospects for Body Cell Defect Passivation Equipment. As the demand for high-performance batteries continues to grow, there is a need for effective techniques to enhance battery efficiency. Body Cell Defect Passivation Equipment offers a cost-effective and flexible solution to address efficiency attenuation issues in sintered batteries. With its ability to improve battery performance, reduce operating costs, and extend battery lifespan, Body Cell Defect Passivation Equipment is likely to see increasing adoption in industries such as renewable energy, electric vehicles, and portable electronics. By enabling more efficient and reliable battery systems, the market prospects for Body Cell Defect Passivation Equipment appear to be favorable, with strong potential for growth in the coming years.

The main function of the body defect passivation equipment is to hydrogen passivate the sintered battery by injecting current, so as to significantly reduce the recombination rate of carriers and weaken the photoattenuation of the battery. Compared with traditional light injection equipment, body defect passivation equipment has the advantages of low energy consumption, low operating costs, flexible process adjustment, and obvious battery efficiency improvement. The body defect passivation device solves the problem of efficiency attenuation caused by boron-oxygen complex, and can passivate impurities and defects in the silicon wafer to improve the efficiency of the battery.
