Abstracts

According to our (Global Info Research) latest study, the global Body Composition Analyzer Modules market size was valued at US\$ 46.57 million in 2025 and is forecast to a readjusted size of US\$ 379 million by 2032 with a CAGR of 26.8% during review period.

A body composition analyzer module typically refers to a dedicated electronic measurement and algorithm unit based on bioelectrical impedance analysis (BIA). It is integrated into body composition analyzers, smart body fat scales, and wearable medical and sports health devices to estimate body fat, muscle, water, and other components. The body composition analyzer module incorporates human bioelectrical impedance measurement circuitry, weight measurement circuitry, and an algorithm microprocessor. It features multiple built-in algorithms to measure vital signs such as weight, body composition, and heart rate, and is characterized by high integration, strong scalability, and high measurement accuracy. The global gross profit margin for body composition analyzer modules in 2025 is approximately 48%.

The core driver of demand lies in the upgrade of health monitoring from 'weight' to 'body composition' and 'multiple vital signs,' as well as the preference for non-invasive, high-frequency measurements in home, sports and health, and medical scenarios. Analog Devices, in its body composition and fluid analysis solutions, emphasizes that its programmable impedance converter supports intracellular and extracellular fluid detection and multi-frequency bioimpedance measurement, providing high flexibility for various health applications.

On the consumer side, Shenzhen Chipsea Technologies has established a complete

product line around health measurement, combining home-use body fat measurement AFEs, wearable body fat measurement AFEs with eight-electrode modules, and integrating them with health algorithms and wireless connectivity, clearly targeting the mass production application of smart body fat scales and wearable health devices. Dongguan BestHealth, through its BMH05108, supports high-precision dual-frequency eight-electrode and single-frequency four-electrode solutions, and provides mobile and Web API interfaces, facilitating brand manufacturers to quickly integrate body composition functions into smart scales, fitness equipment, and even app ecosystems.
