Abstracts

Body fat analyzers are also known as impedance meters is a tool for accurate assessment of body fat and this identify risk associated with health due to high or low amounts of body fat. Moreover these devices also help assess effectiveness of exercise and nutrition intake and age related ages. Body fat measurement is considered as a common fitness test at gymnasium, health clubs. The body fat measuring device when applied to the skin leads to a passage of weak current between the outer two electrodes. As this high frequency current passes through the skin, the muscles and the subcutaneous fat, some amount of energy is lost due to the tissue resistance. This change in the energy is then measured with the help of two inner electrodes. The body fat measurement devices can be designed to measure the flow at different depths.

According to our (Global Info Research) latest study, the global Body Fat Measurement market size was valued at USD 518.9 million in 2022 and is forecast to a readjusted size of USD 817.8 million by 2029 with a CAGR of 6.7% during review period. The influence of COVID-19 and the Russia-Ukraine War were considered while estimating market sizes.

The Asia Pacific region is expected to post the highest CAGR during the forecast period owing to presence of a large number of BIA device manufacturers. Presence of an increasingly healthcare sensitive population in emerging economies such as India and China is supplementing the growth of the regional market.
