According to our (Global Info Research) latest study, the global Boiler TDS Systems market size was valued at US\$ 1009 million in 2024 and is forecast to a readjusted size of USD 1257 million by 2031 with a CAGR of 3.2% during review period.

In this report, we will assess the current U.S. tariff framework alongside international policy adaptations, analyzing their effects on competitive market structures, regional economic dynamics, and supply chain resilience.

The boiler TDS system refers to the boiler total dissolved solids (Total Dissolved Solids) control system. During the operation of the boiler, the feed water contains a certain amount of dissolved solids, which mainly include inorganic salts such as calcium, magnesium, potassium, and sodium. As the boiler runs, the concentration of dissolved solids in the water will gradually increase. If the concentration is too high, it may cause scaling and corrosion inside the boiler, affecting the safety and efficiency of the boiler. Therefore, the role of the boiler TDS system is to monitor and control the concentration of dissolved solids in the boiler water, and to maintain the TDS in the boiler water within a safe and efficient range by continuously or regularly discharging part of the boiler water (blowdown) and replenishing fresh feed water (makeup).
