Abstracts

Bone conduction hearing devices help the people that cannot hear and wear the traditional hearing devices. Bone conduction hearing devices work by conducting or carrying the sounds through the bone. This method is called as bone conduction. Bone conduction hearing devices transmit the sound vibrations directly from the vibrating part of the device to the cochlea through the bone by bypassing the outer and middle ears. Bone conduction hearing devices are thought of as different from traditional hearing devices. Bone conduction hearing devices have been in the market since a few years as a tool to assist the people with hearing disorder.
