Abstracts

According to our (Global Info Research) latest study, the global Bone Density Scanner market size was valued at USD million in 2022 and is forecast to a readjusted size of USD million by 2029 with a CAGR of % during review period.

A bone density scanner, also known as a bone densitometer or dual-energy X-ray absorptiometry (DXA) machine, is a medical imaging device used to measure the density and mineral content of bones. This non-invasive and painless diagnostic tool is primarily employed for the assessment of bone health and the diagnosis of conditions such as osteoporosis, which is characterized by weakened and fragile bones. Bone density scanning provides critical information for evaluating an individual's risk of fractures and the need for preventive measures or treatment.

Bone density scanners typically use a low dose of X-ray radiation to measure the attenuation (absorption) of X-rays as they pass through bone. The resulting images and data are used to calculate BMD values and compare them to standard reference values. The World Health Organization (WHO) defines T-scores and Z-scores to classify bone health and diagnose osteoporosis.

Bone density scanning is an important tool for healthcare providers, especially in the care of postmenopausal women and older adults, who are at higher risk for osteoporosis and fractures. Early diagnosis and intervention based on bone density results can help reduce the risk of fractures and improve overall bone health.
