Bone grafts are implantable materials that promote bone healing, bone formation, and osseous reconstruction due to its osteoconductive, osteogenic, and osteoinductive properties. Bone grafting is a surgical procedure for replacing a missing or defected bone with a material (bone graft) from a patient's own body, cadaver, animals, or a different person. Bone grafts are used in sports, trauma plastic, facial, and spinal surgery. Bone grafting finds its application in wound healing and complex fracture treatment, among others. Bone grafts can also be used to fill voids in case of absence of bones or help in provision of structural stability.
