## Abstracts

Bone grafting is a surgical procedure that involves replacement of missing bone with bone from another part of the patient's body, or an artificial or natural substitute. Bone grafting is feasible because bony tissue has the ability to regrow. As natural bone grows, it replaces the graft completely, resulting in a completely integrated region of new bone. It is seen in prosthodontic procedures, such as dental implants and denture fabrication, where minimal amount of bone needs to be replaced.

### SCOPE OF THE REPORT:

This report focuses on the Bone Graft Substitutes in global market, especially in North America, Europe and Asia-Pacific, South America, Middle East and Africa. This report categorizes the market based on manufacturers, regions, type and application.

Ideal bone graft substitute should be biocompatible,

bioresorbable, osteoconductive, osteoinductive, structurally similar to bone, easy to use and cost effective. Graft substitutes for autologous bone are an appealing alternative.

Substitutes include allograft, mineral composites, ceramics, mineral cements, bioactive glass, proteins, and growth factors.

The use and availability of these products has expanded exponentially. The large number of alternatives available and the relative lack of quality information regarding their indications and effectiveness leave the surgeon desiring to use the products with a daunting task. This article provides the surgeon with an overview of the basic concepts of bone grafting and discusses the most commonly used bone-graft substitutes and their potential indications.

The worldwide market for Bone Graft Substitutes is expected to grow at a CAGR of
