Abstracts

The global Bone Grafts and Bone Powder market size is expected to reach \$ million by 2030, rising at a market growth of % CAGR during the forecast period (2024-2030).

The market for bone grafts and bone powder is witnessing steady growth, driven by increasing demand in orthopedic and dental procedures, as well as advancements in surgical techniques. Bone grafts, which involve the transplantation of bone tissue, are commonly used in procedures such as spinal fusion, joint reconstruction, and dental implants to promote bone healing and regeneration. Bone powder, a finely milled form of bone graft material, offers enhanced handling characteristics and is often used for its convenience in various surgical applications. The market is expected to continue expanding with rising cases of musculoskeletal disorders, an aging population, and a growing emphasis on regenerative medicine. Future developments are likely to focus on improved biomaterials, enhanced graft integration, and the development of innovative delivery systems to further optimize outcomes in bone grafting procedures across diverse medical disciplines.

Bone grafts and bone powder are medical materials used in orthopedic and dental procedures to facilitate bone healing and regeneration. Bone grafts involve the transplantation of bone tissue from one area of the body (autograft) or from a donor source (allograft) to another, promoting the growth of new bone. Bone powder, often derived from processed bone grafts, consists of finely ground particles that can be used to fill voids or gaps in bones, aiding in the formation of new bone tissue. These materials are commonly employed in procedures such as spinal fusions, dental implant surgeries, and orthopedic reconstructions to address fractures, defects, or degenerative conditions. The use of bone grafts and bone powder helps provide structural support, stimulate bone formation, and accelerate the healing process in musculoskeletal

applications.
