## Abstracts

According to our (Global Info Research) latest study, the global Bone Growth Stimulators market size was valued at USD 1076.4 million in 2023 and is forecast to a readjusted size of USD 1371.6 million by 2030 with a CAGR of 3.5% during review period.

Bone growth stimulators are used in cases of delay or failure of fracture healing as they enhance the bone-healing process without the sensation of electrical shocks or currents or vibrations when worn by the user. An internal bone growth stimulator or invasive bone growth stimulator is implanted on the fusion site of the bone and it delivers small electrical currents. The internal bone growth stimulator is removed from the body after 6–12 months. External bone growth stimulator or non-invasive bone growth stimulators are portable devices worn externally and do not require surgical implantation. An external bone growth stimulator is prescribed for use for two to nine hours every day for around three to nine months.

Economic factors such as improvement in service sector, increase in personal income and increase in per capita healthcare expenditure are expected to drive market growth globally. However, various factors such as availability of alternative therapies, uncertainty about efficacy, device-related issues and competition from bone grafts restraint growth of the bone growth stimulators market.
