## **Abstracts**

Bone metastasis is the third most common condition in metastatic cancers and occurs in 60-65% of patients with metastatic cancers. The spine is the most common site of bone metastasis. Other common sites include ribs, skull, pelvis (hip bone), femur (leg bone) and humerus (arm bone). Bone metastatic cancers are rarely able to be cured, and treatment of bone metastasis involves medications to shrink, stop or slow down the growth of the tumor. Treatment options available for bone metastasis are symptomatic treatments which are meant for pain control, treatment, and prevention of fractures, improvement in functional disability, etc. Randomized trials on metastatic patients by UBM Medica, LLC showed that 45-75% patients develop functional disability every 3-4 months, 10-15% patients develop hypercalcemia and 10-20% patients develop long bone fractures.
