Abstracts

Bone minerals are the inorganic compounds of the bone tissue that helps in strengthening the bones with its plate and globular structures. These minerals are formed from carbonated hydroxyapatite. Bone minerals are dynamic in living beings, it is continuously reabsorbed and build anew in the bone remodelling process. Bone functions as storehouse of calcium, from which calcium is continuously withdrawn or stored as a part of homeostasis. Bone mineral metabolism is refers to the maintenance of sufficient concentration of inorganic ions in blood serum irrespective of muscle tissue metabolic activities. Hormones such as parathormone and calcitonin plays vital role in controlling the muscle metabolic activities, these hormones are regulated by neuroendocrine system and produced by parathyroid and thyroid glands in the neck. Malfunction of these glands result in to metabolic in equilibrium and crates the problems of bone mineral metabolism. Bone and mineral density metabolic disorders are abnormalities of bones, caused by calcium, phosphorous, magnesium and vitamin D aberrations leading to several reversible clinical disorders. These disorders are generally treatable if the underlining cause is addressed with corrective treatment methods. These disorders are caused due to genetic or metabolic malfunctions in the body.
