The bone and tooth crusher is a laboratory device specially designed for crushing bone and tooth samples. The bone and tooth crusher is mainly used in the pre-treatment process of DNA laboratory detection of bones and teeth, as well as other fields where bones and teeth need to be crushed. Through the crushing process, it is more convenient to extract DNA and other components in the sample, and then conduct genotyping analysis to obtain relevant genetic information of the victim or the deceased. The equipment usually works by vibration grinding or ball milling. During the crushing process, the sample is placed in a crushing tank, and the sample is impacted and ground by high-speed vibration or rotating grinding balls to achieve the purpose of crushing. Some high-end bone and tooth crushers are also equipped with liquid nitrogen cryogenic freezing technology, which can keep the sample at a low temperature while crushing to avoid heat damage to the sample DNA.
