According to our (Global Info Research) latest study, the global Bone Sonometers market size was valued at USD 476.2 million in 2023 and is forecast to a readjusted size of USD 561.9 million by 2030 with a CAGR of 2.4% during review period.

A bone sonometer is a device that transmits ultrasound energy into the human body to measure acoustic properties of bone that indicate overall bone health and fracture risk. A bone densitometer is a device intended for medical purposes to measure bone density and mineral content by X-ray or gamma ray transmission measurements through the bone and adjacent tissues. The primary components of the device are a voltage generator, a transmitting transducer, a receiving transducer, and hardware and software for reception and processing of the received ultrasonic and rays signal.

Currently, the mainstream market bone density measurement technologies are Dual Energy X-ray Absorptiometry (DEXA, also known as DXA) and Ultrasound.
