Abstracts

The global Book Back Rounding Machine market size is expected to reach \$ 100 million by 2032, rising at a market growth of 6.3% CAGR during the forecast period (2026-2032).

In 2025, global book spine rounding machine production reached approximately 5,700 units. A book spine corner rounding machine is a specialized post-press binding device used to process books after binding, primarily for forming rounded edges on book covers or spine corners. This process improves the visual quality of finished books and enhances handling comfort. The equipment is widely used in the production of hardcover books, notebooks, photo albums, and high-end printed products. Its working principle typically involves mechanical stamping, die pressing, or thermal forming methods to shape the book spine or corners into smooth, uniform arcs, making the products more aesthetically pleasing and durable. The book spine corner rounding machine effectively improves the refinement level of bound products and increases their market value. With the development of the printing and binding industry toward high-end customization and personalization, modern equipment is gradually evolving toward automation, high precision, and multi-specification adaptability to meet diverse production requirements.
