Abstracts

In machining, boring is the process of enlarging a hole that has already been drilled (or cast) by means of a single-point cutting tool (or of a boring head containing several such tools), such as in boring a gun barrel or an engine cylinder. Boring is used to achieve greater accuracy of the diameter of a hole, and can be used to cut a tapered hole.

Boring can be viewed as the internal-diameter counterpart to turning, which cuts external diameters.

Scope of the Report

This report focuses on the Boring Tools in global market, especially in North America, Europe and Asia-Pacific, South America, Middle East and Africa. This report categorizes the market based on manufacturers, regions, type and application.

Onshore segment is expected to be the largest market for drilling tools, by application, in 2017. Approximately 70% of the total oil and gas production in the world takes places at onshore fields. These fields are easier to operate from an exploration perspective and require less capital investment as compared to offshore fields. Formations in onshore wells are more stable during the drilling process than those in offshore. Market demand for drilling tools from onshore segment is also the fastest-growing. US and China with vast onshore reserves present ample market opportunities in this onshore segment. North America is expected to be the largest and the fastest-growing market, by region, during the forecast period. Increasing shale gas production and energy reforms of respective countries would drive the growth of the drilling tools in the region. Asia Pacific is expected to be the second fastest-growing market for drilling tools.

The worldwide market for Boring Tools is expected to grow at a CAGR of roughly xx% over the next five years, will reach xx million US\$ in 2023, from xx million US\$ in 2017, according to a new GIR (Global Info Research) study.
