According to our (Global Info Research) latest study, the global Boron for Injection market size was valued at US\$ 64.82 million in 2025 and is forecast to a readjusted size of US\$ 131 million by 2032 with a CAGR of 10.7% during review period.

Boron for Injection is the core drug used in boron neutron capture therapy (BNCT), and its main component is the boron-10 isotope. During treatment, the boron drug is first injected into the patient's body. This drug selectively accumulates in tumor cells, acting as 'bullets' for marking. Subsequently, the tumor site is irradiated with a neutron beam. The boron-10 'captures' the neutrons and undergoes a nuclear reaction, releasing highly lethal particles with extremely short ranges, thereby precisely destroying cancer cells while avoiding damage to surrounding healthy tissue, achieving 'targeted radiotherapy' at the cellular level.

The development prospects of Boron for Injection are broad. Clinical indications are expanding from gliomas and head and neck cancers to more cancer types such as liver and lung cancer. Technological advancements are the core driving force. Third-generation boron drugs, represented by nanomedicines and peptide/antibody conjugates, are under development, aiming to achieve higher tumor targeting and enrichment. The industrial ecosystem is rapidly taking shape. my country has successfully developed its own BNCT treatment device, and domestically produced boron drugs have entered the clinical trial stage, marking the rapid industrialization of 'drug-device synergy.'
