According to our (Global Info Research) latest study, the global Borosilicate Microglass market size was valued at US\$ 2188 million in 2025 and is forecast to a readjusted size of US\$ 3370 million by 2032 with a CAGR of 6.3% during review period.

Borosilicate microglass is an ultra-fine glass material made from borosilicate compositions (SiO_2 – B_2O_3 –alkali oxides) processed into micro-scale fibers, powders, or hollow microspheres, valued for its low thermal expansion, high temperature resistance, chemical inertness, optical clarity, and electrical insulation; it is widely used in filtration media, battery separators, thermal insulation, composites reinforcement, electronic substrates, and precision fillers in coatings and adhesives. Its supply chain begins upstream with high-purity silica sand, boric acid/boron oxide, soda ash, and alumina sourced from specialty mineral suppliers; midstream, these raw materials are melted in high-temperature furnaces and converted into micro-scale forms through fiber drawing, flame attenuation, centrifugal spinning, or spray-drying/microsphere formation by glass processors; downstream, the microglass is surface-treated, classified by size, and compounded or laminated into functional products such as filter papers, insulation mats, battery membranes, prepregs, and engineered fillers, which are then integrated by OEMs in energy storage, electronics, aerospace, construction, and industrial filtration markets. In 2025, global Borosilicate Microglass production reached about 320 kilotons against an installed capacity of roughly 395 kilotons, with average prices of USD 6,000–9,000 per ton and industry gross margins near 38%.
