According to our (Global Info Research) latest study, the global Breast Cancer Monoclonal Antibodies market size was valued at USD million in 2023 and is forecast to a readjusted size of USD million by 2030 with a CAGR of % during review period.

Breast cancer is characterized by the malignancy of cells in the tissues of the breast. HER-2 breast cancer is the most common type of breast cancer. The HER-2 protein, present on the surface of normal breast cells, affects the growth of the malignant cells. The uncontrolled synthesis of this protein stimulates the growth and division of malignant cells.

The breast cancer monoclonal antibodies (mAbs) market is one of the fastest-growing segments of the global mAbs market and has gained major research significance among biotech and pharmaceutical companies due to the presence of high unmet needs in this area. Antibodies are increasingly becoming the best choice to treat cancers, including breast cancer. The use of antibody-drug conjugates (ADCs), including radioimmunotherapy and antibody-directed enzyme prodrug therapy, is increasing rapidly. ADCs are highly effective cytotoxic drugs linked to mAbs. These drugs have shown to be potent and efficient in treating breast cancer. This has propelled vendors to focus on novel technologies such as Seattle Genetics (SGEN), ImmunoGen (IMGN), and Immunomedics (IMMU). The rising use of these antibodies in drug development increases revenue generation in the breast cancer mAbs market, contributing to market growth.
