## Abstracts

The global Breast CT market size is expected to reach \$ 1566 million by 2029, rising at a market growth of 3.8% CAGR during the forecast period (2023-2029).

Breast disease is a frequently-occurring and common disease, especially breast cancer seriously endangers people's health. The earlier the diagnosis is, the more the survival rate can be improved. Imaging detection methods play an important role in the diagnosis of breast cancer. Currently, there are three main methods for routine breast imaging: mammography, ultrasound and MRI. Mammography is extremely important for early screening of breast cancer and improving patient survival rates. Research shows that for every 1,224 people screened, one life is saved; a group of surveys shows that the breast cancer mortality rate for women aged 30 to 79 years was 49.7 per 100,000 in 1990, which dropped to 38.0 in 2000. A decrease of 24% from 1990, which may be due to the early detection and improvement of treatment levels through mammography; mammography has been proven to be a cost-effective and cost-effective examination method to save the lives of breast cancer patients.

Breast CT (Breast Computed Tomography, BCT) is a medical imaging technology used for breast imaging, which uses X-ray and computed tomography (CT) technology to obtain detailed images of the breast. This imaging technology can help doctors detect breast abnormalities, lumps, calcifications and other conditions.
