Abstracts

The global Breathable Airslide Fabrics market size is expected to reach \$ 194 million by 2032, rising at a market growth of 4.2% CAGR during the forecast period (2026-2032).

Breathable airslide fabrics are specialized textile materials designed for pneumatic conveying applications, particularly in industries such as cement, food processing, and chemical processing. These fabrics feature a porous structure that allows for the passage of air or gas while effectively containing and conveying bulk materials such as powders, granules, and other free-flowing substances. Typically made from woven polyester or polyamide materials, breathable airslide fabrics offer high tensile strength, durability, and resistance to abrasion, making them suitable for use in demanding industrial environments. The permeable nature of these fabrics facilitates the controlled movement of materials along conveyor systems powered by air pressure, enabling efficient and reliable transportation of bulk solids within processing facilities. In 2025, global Breathable Airslide Fabrics reached approximately 34607.2 Tons, with an average global market price of around 4089.9 USD per Ton.

The upstream raw materials for Breathable Airslide Fabrics mainly include polyester fiber, aramid fiber, etc., with typical suppliers including Indorama Ventures, Teijin, DuPont, Kolon, etc. Downstream applications are primarily in industries such as cement, chemicals, power generation, mining and metals, and food. The single-line capacity of Breathable Airslide Fabrics is directly related to the production line configuration, process type, product specifications, and operating efficiency. Typically, a single line has a daily capacity of approximately 10–20 tons, with a gross profit margin ranging from 20% to 40%.

Breathable Airslide Fabrics are specialized industrial textiles designed to enable the

fluidization and low-friction conveying of bulk powder and granular materials by allowing controlled airflow to pass through the fabric. When air is introduced beneath or behind the fabric, it permeates evenly through the material, creating a thin air layer that causes the bulk solid to behave like a fluid. This significantly reduces internal friction and allows materials to flow smoothly by gravity or minimal pressure. These fabrics are commonly used in airslide conveyors, aeration pads, bins, silos, hoppers, and discharge systems, especially for fine, dry, and free-flowing powders such as cement, fly ash, alumina, flour, and chemical powders. Manufactured from materials such as polyester, polyamide, polypropylene, aramid, or cotton, Breathable Airslide Fabrics are engineered for specific air permeability, strength, abrasion resistance, temperature tolerance, and chemical compatibility, ensuring reliable and energy-efficient bulk material handling.
